

What's New In ARC Plus Version 2.0

Includes AutoPilot[®] Plus, AutoLoad Plus and ARC Plus firmware

All-new charting feature plots meter values in real-time. Support for two y-axes allows comparisons of values with different units and scales.

New custom view controls include:

- POWER METER for automatic VSWR calculation
- TREND ARROW, showing the increase/decrease or steady trends over a user-defined period
- EMBEDDED WEB PAGE for control of web-enabled devices or access to online resources directly from AutoPilot Plus

Log viewer provides quick access to logged data without generating a report.

Redesigned reports maximize performance and allow greater flexibility of content and organization.

New macro commands include:

- SET LIMIT. Allows a macro to change meter limits (ideal for day/night AM power levels)
- IF CALENDAR TIME. References the onboard calendar, allowing the macro to take action based on a sunrise/sunset or user-defined calendar time.
- SPEAK PHRASE. Allows the ESI Plus to output a phrase using the ESI Plus input/output jack.*

Ability to **override command channels** with macros, providing easier access to macros via front panel command buttons, ESI Plus, AutoPilot Plus and web interface.

**To output ESI audio to the external jack, remove the top cover of the ARC Plus and move the 2-pin jumper at P5 to connect the center and right pins. This allows building annunciation systems to connect to the ESI Plus, with status conditions announced using the SPEAK PHRASE macro command. This mode overrides the audio input function, which is achieved by connecting the center and left pins at P5.*
